### Thin clients versus PC's:

Thin clients are passive devices that function as network computer in a server based computing network. Using thin clients reduces the ICT total cost of ownership with 49%. Thin clients are simple to deploy and manage and are not vulnerable for viruses and other threats. One can opt to have either a Windows, Linux or Unix server environment.

Why choose Windows XPembedded is the right operating system when one needs high performance combined with locally installed or streamed software.
